TΙ Human cDNAs and proteins and uses thereof

AB The invention concerns GENSET polynucleotides and polypeptides. Such GENSET products may be used as reagents in forensic analyses, as chromosome markers, as tissue/cell/organelle-specific markers, in the production of expression vectors. In addition, they may be used in screening and diagnosis assays for abnormal GENSET expression and/or

biological activity and for screening compounds that may be used in the treatment of GENSET-related disorders.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.

TI Porcine adenovirus type 3 genome

The complete nucleotide sequence of the genome of porcine adenovirus type 3 (PAV-3) is provided. Methods for construction of infectious PAV genomes by homologous recombination in procaryotic cells are provided. Recombinant PAV viruses are obtained by transfection of mammalian cells with recombinant PAV genomes. The PAV-3 genome can be used as a vector for the expression of heterologous nucleotide sequences, for example, for the preparation and administration of subunit vaccines to swine or other mammals. In addition, PAV-3 vectors can be used for gene therapy and expression of heterologous polypeptides. PAV-3 genome sequences can also be used for diagnostic purposes, to detect the presence of PAV-3 DNA in a subject or biological sample.

ACCESSION NUMBER: 2003:188394 USPATFULL

TI Compositions and methods for use in isolation of nucleic acid molecules
The present invention relates generally to recombinant genetic
technology. More particularly, the present invention relates to
compositions and methods for use in selection and isolation of nucleic
acid molecules. The invention further relates to methods for the
preparation of individual nucleic acid molecules and populations of
nucleic acid molecules, as well as nucleic acid molecules produced by
these methods. The invention also relates to screening and/or selection
methods for identifying and/or isolating nucleic acid molecules which
have one or more common features (e.g., characteristics, activities,
etc) and populations of nucleic acid molecules which share one or more
features.

TI Chimeric capsid proteins and uses thereof

AB The present invention encompasses chimeric capsid proteins, nucleic

acids encoding such proteins and capsids containing chimeric capsid proteins. Methods of making the chimeric capsid proteins, the nucleic acids that encode such proteins and capsids that contain chimeric capsid proteins are also encompassed within the scope of the invention. The invention further encompasses the use of the chimeric capsid proteins to produce protein elements and to present the elements for use in structure-function studies, for use as therapeutic factors and for other purposes. Other embodiments of the invention will be apparent to those skilled in the art from consideration of the specification and practice of the invention disclosed herein. It is intended that the specification and examples be considered as exemplary only.

TI Tryptase-like polypeptide ztryp1

The present invention relates to polynucleotide and polypeptide molecules for mouse ztryp1, a novel member of the serine protease family of proteins. The polynucleotides encoding mouse ztryp1 can be used to identify a human ortholog or to create a mouse model associated with human disease states. The present invention also includes methods for producing the protein, uses therefor and antibodies thereto.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.

L9 ANSWER 9 OF 210 USPATFULL

Identification and comparison of protein-protein interactions that occur TIin populations and identification of inhibitors of these interactors Methods are described for detecting protein-protein interactions, among AB two populations of proteins, each having a complexity of at least 1,000. For example, proteins are fused either to the DNA-binding domain of a transcriptional activator or to the activation domain of a transcriptional activator. Two yeast strains, of the opposite mating type and carrying one type each of the fusion proteins are mated together. Productive interactions between the two halves due to protein-protein interactions lead to the reconstitution of the transcriptional activator, which in turn leads to the activation of a reporter gene containing a binding site for the DNA-binding domain. This analysis can be carried out for two or more populations of proteins. The differences in the genes encoding the proteins involved in the protein-protein interactions are characterized, thus leading to the identification of specific protein-protein interactions, and the genes encoding the interacting proteins, relevant to a particular tissue, stage or disease. Furthermore, inhibitors that interfere with these protein-protein interactions are identified by their ability to inactivate a reporter gene. The screening for such inhibitors can be in a multiplexed format where a set of inhibitors will be screened against a library of interactors.

TI APM1 biallelic markers and uses thereof

AB The invention provides novel APM1 genomic sequences, polypeptides, antibodies, and polynucleotides including biallelic markers derived from the APM1 locus. Primers hybridizing to regions flanking these biallelic markers are also provided. This invention also provides polynucleotides and methods suitable for genotyping a nucleic acid containing sample for one or more biallelic markers of the invention. Additionally, the invention provides methods to detect a statistical correlation between a biallelic marker allele and a phenotype and/or between a biallelic marker haplotype and a phenotype. Further, the invention provides diagnostic methods for early detection of obesity-related disorders.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.

TI Non-stochastic generation of genetic vaccines

This invention provides methods of obtaining vaccines by use of non-stochastic methods of directed evolution (DirectEvolution.TM.). These methods include non-stochastic polynucleotide site-satuaration mutagenesis (Gene Site Saturation Mutagenesis.TM.) and non-stochastic polynucleotide reassembly (GeneReassembly.TM.). Through use of the claimed methods, vectors can be obtained which exhibit increased efficacy for use as genetic vaccines. Vectors obtained by using the methods can have, for example, enhanced antigen expression, increased uptake into a cell, increased stability in a cell, ability to tailor an immune response, and the like.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.

TI Random **DNA fragmentation** with endonuclease V: application to DNA shuffling.

AB The enzyme endonuclease V nicks uracil-containing DNA at the second or third phosphodiester bond 3' to uracil sites. I applied the enzyme to random fragmentation of DNA to revise the complex DNA shuffling protocol. The merit of using endonuclease V is that cleavage occurs at random sites and the length of the fragments can easily be adjusted by varying the concentration of dUTP in the polymerase chain reaction. Unlike the conventional method using DNase I, no partial digestion or gel separation of fragments is required. Therefore, labor is dramatically reduced and reproducibility ensured. I applied this method to recombine two truncated green fluorescent protein (GFP) genes and demonstrated successful DNA shuffling by the appearance of the fluorescent full-length GFP genes.

TI Gel microdrops in genetic analysis

The invention provides methods of nucleic acid analysis. Such methods AB entail forming a population of gel microdrops encapsulating a population of biological entities, each entity comprising a nucleic acid, whereby at least some microdrops in the population each encapsulate a single entity. The population of gel microdrops is then contacted with a probe under conditions whereby the probe specifically hybridizes to at least one complementary sequence in the nucleic acid in at least one gel microdrop. At least one gel microdrop is then analyzed or detected. The biological entities can be cells, viruses, nuclei and chromosomes.

TI Method of producing a DNA library using positional amplification

AB The disclosed invention relates to general and specific methods to

The disclosed invention relates to general and specific methods to use the Primer Extension/Nick Translation (PENT) reaction to create an amplifiable DNA strand, called a PENTAmer. A PENTAmers can be made for the purpose of amplifying a controlled length of DNA located at a controlled position within a DNA molecule, a process referred to as Positional Amplification by Nick Translation (PANT). In contrast to PCR, which amplifies DNA between two specific sequences, PANT can amplify DNA between two specific positions. PENTAmers can be created to amplify very large regions of DNA (up to 500,000 bp) as random mixtures (unordered positional libraries), or as molecules sorted according to position (ordered positional libraries). PANT is fast and economical, because PENTAmer preparation can be multiplexed. A single PENTAmer preparation can include very complex mixtures of DNA such as hundreds of large-insert clones, complete genomes, or cDNA libraries. Subsequent PCR amplification of the preparation using a single specific primer can positionally amplify contiguous regions along a specific clone, along a specific genomic region, or along a specific expressed sequence.

L2 ANSWER 56 OF 70 USPATFULL

TI Methods for producing protein domains and analyzing three dimensional

structures of proteins by using said domains

AB There is provided a method for producing a soluble

protein domain comprising: (a) preparing two or more

DNA fragments by partially digesting a DNA coding for a protein; (b) expressing the protein which is coded on each of said DNA fragments, as a fusion protein with a functional protein; (c)

selecting the fusion protein exhibiting said

function among two or more fusion proteins synthesized in step (b); and, (d) synthesizing the soluble protein domain

which is coded on said DNA fragment in a cell-free system, wherein said

soluble protein domain is included in said fusion protein selected in step (c). By using this

method, it can be easy and efficient to analyze the three dimensional

structure of proteins of many clones.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.

TI Secreted and transmembrane polypeptides and nucleic acids encoding the same

The present invention is directed to novel polypeptides and to nucleic acid molecules encoding those polypeptides. Also provided herein are vectors and host cells comprising those nucleic acid sequences, chimeric polypeptide molecules comprising the polypeptides of the present invention fused to heterologous polypeptide sequences, antibodies which bind to the polypeptides of the present invention and to methods for

producing the polypeptides of the present invention.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.

TI Secreted and transmembrane polypeptides and nucleic acids encoding the

The present invention is directed to novel polypeptides and to nucleic acid molecules encoding those polypeptides. Also provided herein are vectors and host cells comprising those nucleic acid sequences, chimeric polypeptide molecules comprising the polypeptides of the present invention fused to heterologous polypeptide sequences, antibodies which bind to the polypeptides of the present invention and to methods for producing the polypeptides of the present invention.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.

TI Secreted and transmembrane polypeptides and nucleic acids encoding the

same

The present invention is directed to novel polypeptides and to nucleic acid molecules encoding those polypeptides. Also provided herein are vectors and host cells comprising those nucleic acid sequences, chimeric polypeptide molecules comprising the polypeptides of the present invention fused to heterologous polypeptide sequences, antibodies which bind to the polypeptides of the present invention and to methods for producing the polypeptides of the present invention.
